

Certificate of Environmental and Structural Safety

ROTban Roof Treatment has been manufactured for use on all roofing products. It is a gentle, spray-on algaecide which bonds to the surface of outdoor construction products.

ROTban was first tested at Ocean Park Estates in 1998. After two years of observation, no damage was found, either to roofing or to the plants in the gardens into which the drainage discharged. It has been applied to thousands of roofs over a period of 12 years since the test was completed, without incident, other than minor issues in the early years, relating to worker error. Many written testimonials are available from homeowners and Property Managers over that time.

Asphalt shingles, tar and gravel roofs, cedar roofs, concrete tile roofs are daily experiencing the benefits of ROTban Treatment. They are tending to remain in their original manufactured condition for much longer, due to the absence of destructive microbe growth.

This product is neutralized quickly in the surrounding soil when it naturally drains there. On the roof, it remains for years as a gentle algaecide to discourage re-colonization.
